WORLD INVESTMENT REPORT

**Transnational Corporations,
and the Infrastructure Challenge**

UNITED NATIONS
New York and Geneva, 2008

NOTE

As the focal point in the United Nations system for investment and technology, and building on 30 years of experience in these areas, UNCTAD, through DIAE, promotes understanding of key issues, particularly matters related to foreign direct investment and transfer of technology. DIAE also assists developing countries in attracting and benefiting from FDI and in building their productive capacities and international competitiveness. The emphasis is on an integrated policy approach to investment, technological capacity building and enterprise development.

The terms country/economy as used in this Report also refer, as appropriate, to territories or areas; the designations employed and the presentation of the material do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country, territory, city or area or of its authorities, or concerning the delimitation of its frontiers or boundaries. In addition, the designations of country groups are intended solely for statistical or analytical convenience and do not necessarily express a judgement about the stage of development reached by a particular country or area in the development process. The major country groupings used in this Report follow the classification of the United Nations Statistical Office. These are:

Developed countries: the members countries of the OECD (other than Mexico, the Republic of Korea and Turkey), plus the new European Union member countries which are not OECD members (Bulgaria, Cyprus, Estonia, Latvia, Lithuania, Malta, Romania and Slovenia), plus Andorra, Israel, Liechtenstein, Monaco and San Marino.

Transition economies: South-East Europe and the Commonwealth of Independent States.

Developing economies: in general all economies not specified above. For statistical purposes, the data for China do not include those for Hong Kong Special Administrative Region (Hong Kong SAR), Macao Special Administrative Region (Macao SAR) and Taiwan Province of China.

Reference to companies and their activities should not be construed as an endorsement by UNCTAD of those companies or their activities.

The boundaries and names shown and designations used on the maps presented in this publication do not imply official endorsement or acceptance by the United Nations.

The following symbols have been used in the tables:

Two dots (..) indicate that data are not available or are not separately reported. Rows in tables have been omitted in those cases where no data are available for any of the elements in the row;

A dash (–) indicates that the item is equal to zero or its value is negligible;

A blank in a table indicates that the item is not applicable, unless otherwise indicated;

A slash (/) between dates representing years, e.g., 1994/95, indicates a financial year;

Use of an en dash (–) between dates representing years, e.g., 1994–1995, signifies the full period involved, including the beginning and end years;

Reference to “dollars” (\$) means United States dollars, unless otherwise indicated;

Annual rates of growth or change, unless otherwise stated, refer to annual compound rates;

Details and percentages in tables do not necessarily add to totals because of rounding.

The material contained in this study may be freely quoted with appropriate acknowledgement.

PREFACE

World foreign direct investment inflows rose last year to a record level of \$1.8 trillion. Developing and transition economies attracted more flows than ever before, reaching nearly \$600 billion – a 25 per cent increase over 2006, and a third of the global total. While global foreign direct investment flows are projected to decline this year, those to developing and transition economies are expected to suffer less, despite the current financial and credit crisis.

One of the main challenges for the international community is to mobilize greater financial flows for investment conducive to poverty reduction and the achievement of the Millennium Development Goals. In particular, developing countries require investments that will strengthen the infrastructure industries and services that are so essential for future growth and for the social well-being of the poor. The *World Investment Report 2008* examines the ways, extent and conditions under which transnational corporations can contribute to meeting the infrastructure challenge.

The *Report* argues that while the participation of transnational corporations in the infrastructure sector of developing countries has risen significantly, a huge gap remains between current investment levels and what is still needed. Filling the investment gap is particularly urgent in the case of essential infrastructure industries, such as water and electricity; and is critically important in sectors such as telecommunications and transport.

The *Report* cautions against unrealistic expectations about the contribution of transnational corporations. Companies will only invest in infrastructure projects that can assure adequate returns for commensurate risks. It has proven difficult for countries with small economies and weak governance systems to attract transnational corporations into infrastructure. The policy challenge is to create the appropriate conditions to facilitate investments that can contribute to poverty alleviation and accelerated development.

There is a need to encourage greater involvement by transnational corporations and to maximize host-country benefits from their technological and other assets. This implies improved governance and capacity-building in host countries, the provision of greater financial and technical support from development partners, and responsible infrastructure investors. A concerted effort by all parties is required. Toward that end, this *Report* offers valuable information and analysis, and I commend it to a wide global readership.

New York, July 2008

Ban Ki-moon
Secretary-General of the United Nations

ACKNOWLEDGEMENTS

The *World Investment Report 2008 (WIR08)* was prepared by a team led by Anne Miroux, comprising Kumi Endo, Torbjörn Fredriksson, Masataka Fujita, Kálmán Kalotay, Guoyong Liang, Padma Mallampally, Hafiz Mirza, Nicole Moussa, Abraham Negash, Hilary Nwokeabia, Jean François Outreville, Thomas Pollan, Yunsung Tark, Astrit Sulstarova, Thomas van Giffen and Kee Hwee Wee. Amare Bekele, Hamed El-Kady, Joachim Karl and Shin Ohinata also contributed to the Report.

John H. Dunning was the senior economic adviser and Peter Buckley served as principal consultant.

Research assistance was provided by Mohamed Chiraz Baly, Bradley Boicourt, Jovan Licina, Lizanne Martinez and Tadelles Taye. Aurelia Figueroa, Julia Kubny and Dagmar van den Brule assisted as interns at various stages. Production of the *WIR08* was carried out by Severine Excoffier, Rosalina Goyena, Chantal Rakotondrainibe and Katia Vieu. It was edited by Praveen Bhalla and desktop published by Teresita Ventura.

WIR08 benefited from inputs provided by participants at a global seminar in Geneva in May 2008, and two regional seminars on TNCs in infrastructure industries held in April 2008: one in Santiago, Chile (in cooperation with the Economic Commission for Latin America and the Caribbean), and the other in Johannesburg, South Africa (in cooperation with the Development Bank of Southern Africa).

Inputs were also received from Emin Akcaoglu, Maria Argiri, Úna Clifford, Judith Clifton, Zureka Davids, Georgina Dellacha, Yves de Rosée, Daniel Diaz-Fuentes, Quentin Dupriez, Fabrice Hatem, Hayley Herman, Thomas Jost, Céline Kauffmann, Michael Likosky, Michael Minges, El Iza Mohamedou, Bishakha Mukherjee, Sam Muradzikwa, Barbara Myloni, Sanusha Naidu, Premila Nazareth, Federico Ortino, David Lloyd Owen, Terutomo Ozawa, Robert Pearce, Edouard Pérard, Ravi Ramamurti, Mannsoo Shin, Satwinder Singh, Lalita Som, Vincent Valentine, Mira Wilkins and Zbigniew Zimny.

Comments and suggestions were received during various stages of preparation from Joe Amadi-Echendu, Philippa Biggs, Elin Bjerkebo, Doug Brooks, Joel Buarte, Barry Cable, Karine Campanelli, Fanny Cheung, Georgina Cipoletta, Rudolf Dolzer, Chantal Dupasquier, Sean Fahnhorst, Masondo Fikile, Bongsi Gasa, Stephen Gelb, Axèle Giroud, David Hall, Geoffrey Hamilton, Toru Homma, Gabor Hunya, Prakash Hurry, Anna Joubin-Bret, Andrei Jouravlev, Detlef Kotte, Thithi Kuhlase, Aimable Mapendano Uwizeye, Shirley Masemola, David Matsheketsheke, Arvind Mayaram, Patricio Millan, Reatile Mochebelele, Seeraj Mohamed, Juan Carlos Moreno-Brid, Tladinyane Moronngoe, Thierry Mutombo Kalonji, Peter Muchlinski, Julius Mucunguzi, Judith Nwako, Sheila Page, Antonio Pedro, Wilson Phiri, Helder Pinto, Jaya Prakash Pradhan, Carlos Razo, Alex Roehrl, Fikile Rouget, Patricio Rozas, Alex Rugamba, Winifred Rwebeyanga, Ricardo Sanchez, Fernando Sanchez Albavera, Miguel Santillana, Christoph Schreuer, Njabulo Sithebe, Miguel Solanes, Admassu Tedesse, Hong Song, Xuekun Sun, Marcia Tavares, Khwezi Tiya, Ignacio Torterola, Peter Utting, Jörg Weber, Paul Wessendorp, Thomas Westcott, Márcio Wohlers, Lulu Zhang and Xuan Zengpei.

Numerous officials of central banks, statistical offices, investment promotion and other government agencies, and officials of international organizations and non-governmental organizations, as well as executives of a number of companies also contributed to *WIR08*, especially with the provision of data and other information. The Report also benefited from collaboration with Erasmus University, Rotterdam, in the collection of data on, and analysis of, the largest TNCs.

The financial support of the Governments of France, Norway and Sweden is gratefully acknowledged.

OVERVIEW	xvii
 PART ONE RECORD FLOWS IN 2007, BUT SET TO DECLINE	
CHAPTER I. GLOBAL TRENDS	3
A. FDI AND INTERNATIONAL PRODUCTION	3
1. Recent trends in FDI	3
a. Overall trends	3
b. Geographical patterns	7
(i) Developed countries	7
(ii) Developing countries	8
(iii) South-East Europe and CIS	9
c. Sectoral patterns	9
2. International production	9
3. Indices of FDI performance and potential	10
4. New developments in FDI policies	11
a. Developments at the national level	11
b. Developments at the international level	14
(i) Bilateral investment treaties	14
(ii) Double taxation treaties	16
(iii) International investment agreements other than BITs and DTTs	16
(iv) Investor-State dispute settlement	16
(v) Implications of recent developments	17
B. CURRENT FINANCIAL AND MONETARY DEVELOPMENTS AND FDI	18
1. The current financial crisis and FDI flows	18
2. Influence of the falling dollar on FDI decisions	19
C. FDI BY SOVEREIGN WEALTH FUNDS	20
1. Characteristics of SWFs	20
2. Investment patterns	20
3. Growing concerns about SWFs	25
D. THE LARGEST TNCs	26
1. The world's top 100 TNCs	26
2. The top 100 TNCs from developing economies	29
3. Profitability of the largest TNCs	30
4. The world's top 50 financial TNCs	31
E. PROSPECTS	32
CHAPTER II. REGIONAL TRENDS	37
INTRODUCTION	37
A. DEVELOPING COUNTRIES	38
1. Africa	38
a. Geographical trends	38
(i) Inward FDI: increased flows, not just to oil producers	38
(ii) Outward FDI: mainly driven by South Africa	42

	Page
b. Sectoral trends: a rise of inflows to services	42
c. Policy developments.....	43
d. Prospects: commodity prices boost FDI.....	46
2. South, East, South-East Asia and Oceania.....	46
a. Geographical trends.....	47
(i) Inward FDI: widespread increases	47
(ii) Outward FDI: growth led by services and extractive industries	49
b. Sectoral trends: rising flows to all sectors.....	50
c. Policy developments.....	51
d. Prospects: remaining promising	53
3. West Asia.....	53
a. Geographical trends.....	53
(i) Inward FDI: a sustained increase	53
(ii) Outward FDI soared.....	55
b. Sectoral trends: strong focus on services.....	56
c. Policy developments.....	57
d. Prospects: FDI set to remain stable	58
4. Latin America and the Caribbean.....	58
a. Geographical trends.....	58
(i) Inward FDI surged mainly in South America	58
(ii) Outward FDI fell in 2007 after a significant increase in 2006	60
b. Sectoral trends: growth led by primary and natural-resource-based activities.....	60
c. Policy developments.....	63
d. Prospects: growth of inflows and outflows	65
B. SOUTH-EAST EUROPE AND THE COMMONWEALTH OF INDEPENDENT STATES ...	66
1. Geographical trends	66
a. Inward FDI: growing market-seeking FDI.....	66
b. Outward FDI: Russian TNCs expanding abroad.....	68
2. Sectoral trends: services dominate.....	69
3. Policy developments	70
4. Prospects: natural resources will continue to attract FDI.....	71
C. DEVELOPED COUNTRIES	72
1. Geographical trends	72
a. Inward FDI: more vibrant in the EU	72
b. Outward FDI: strong net outward investments	75
2. Sectoral trends: significant increase in manufacturing.....	76
3. Policy developments	77
4. Prospects: FDI growth likely to decline in the short term	78
PART TWO	
TRANSNATIONAL CORPORATIONS AND	
THE INFRASTRUCTURE CHALLENGE	
INTRODUCTION	85
CHAPTER III. TNCs IN INFRASTRUCTURE INDUSTRIES	87
A. MAIN FEATURES OF INFRASTRUCTURE INDUSTRIES	
AND EMERGING ISSUES.....	87
1. Characteristics of infrastructure industries	87
2. The infrastructure investment gap in developing countries	92
3. The role of the State and other players in infrastructure industries	94
B. TNC INVOLVEMENT IN INFRASTRUCTURE INDUSTRIES	97
1. Global trends	99

	Page
2. TNC involvement in developing countries	102
C. THE UNIVERSE OF INFRASTRUCTURE TNCs	107
1. Major infrastructure TNCs	107
2. Major infrastructure investors in developing countries by industry	110
3. South-South investors in developing countries	112
D. COMPETITIVE ADVANTAGES, DRIVERS AND STRATEGIES OF INFRASTRUCTURE TNCs	113
1. Sources of competitive advantages	113
2. Drivers, motives and modalities of infrastructure TNCs	116
a. Drivers and motives	116
b. Modalities of TNC involvement	117
3. Internationalization strategies of infrastructure TNCs	118
E. CONCLUSIONS.....	119
CHAPTER IV. IMPACT OF TNC PARTICIPATION ON HOST DEVELOPING COUNTRIES.....	125
A. TNCs' ROLE IN MOBILIZING FINANCIAL RESOURCES AND THE IMPACT ON INVESTMENT IN INFRASTRUCTURE INDUSTRIES.....	126
B. IMPACT ON INDUSTRY PERFORMANCE AND THE PROVISION OF INFRASTRUCTURE SERVICES	129
1. Technology transfer and diffusion.....	130
2. Effects on competition and efficiency.....	131
3. Impact on provision of services and implications for universal access	134
a. Electricity	136
b. Telecommunications.....	137
c. Transport.....	138
d. Water and sanitation	139
C. BROADER DEVELOPMENT IMPACTS AND ISSUES	140
1. Wider economic impacts.....	141
2. Bargaining power and regulatory concerns.....	143
D. CONCLUSIONS.....	144
CHAPTER V. POLICY CHALLENGES AND OPTIONS	149
A. A COMPLEX CHALLENGE	149
B. HOST-COUNTRY POLICIES TO ATTRACT AND BENEFIT FROM TNC PARTICIPATION	150
1. Building the institutional and regulatory framework	150
2. Openness to TNC involvement varies by industry and country.....	152
a. In electricity, openness is the greatest in the generation segment	153
b. Almost all countries allow TNCs to invest in telecommunications	154
c. Water remains highly restricted.....	154
d. Road transport the most open, rail transport the least	155
e. Rising concerns related to the strategic nature of infrastructure	155
3. Investment promotion agencies attach growing importance to infrastructure	157
4. Managing different forms of TNC participation	159
5. Factoring in social objectives.....	161

	Page
C. INTERNATIONAL INVESTMENT AGREEMENTS AND INVESTMENT DISPUTES	162
1. The role of international investment agreements	162
2. Infrastructure-related investment disputes	164
a. Many investment disputes are related to infrastructure.....	164
b. Recent arbitral decisions on core IIA provisions.....	165
(i) Fair and equitable treatment.....	166
(ii) Expropriation.....	166
(iii) Umbrella clause.....	167
3. Conclusions and implications	168
D. THE ROLE OF HOME COUNTRIES AND INTERNATIONAL INSTITUTIONS	169
1. Making better use of official development assistance.....	169
2. Risk-mitigating measures	171
a. Coverage for political risk.....	172
b. Coverage for credit risk.....	174
c. Coverage for currency risk.....	174
3. Capacity-building measures	175
4. Promoting regional infrastructure projects.....	176
E. CONCLUSIONS.....	176

OVERVIEW

RECORD FLOWS IN 2007, BUT SET TO DECLINE

Global FDI flows surpassed the peak of 2000...

After four consecutive years of growth, global FDI inflows rose in 2007 by 30% to reach \$1,833 billion, well above the previous all-time high set in 2000. Despite the financial and credit crises, which began in the second half of 2007, all the three major economic groupings – developed countries, developing countries and the transition economies of South-East Europe and the Commonwealth of Independent States (CIS) – saw continued growth in their inflows. The increase in FDI largely reflected relatively high economic growth and strong corporate performance in many parts of the world. Reinvested earnings accounted for about 30% of total FDI inflows as a result of increased profits of foreign affiliates, notably in developing countries. To some extent, the record FDI levels in dollar terms also reflected the significant depreciation of the dollar against other major currencies. However, even measured in local currencies, the average growth rate of global FDI flows was still 23% in 2007.

FDI inflows into developed countries reached \$1,248 billion. The United States maintained its position as the largest recipient country, followed by the United Kingdom, France, Canada and the Netherlands. The European Union (EU) was the largest host region, attracting almost two thirds of total FDI inflows into developed countries.

In developing countries FDI inflows reached their highest level ever (\$500 billion) – a 21% increase over 2006. The least developed countries (LDCs) attracted \$13 billion worth of FDI in 2007 – also a record high. At the same time, developing countries continued to gain in importance as sources of FDI, with outflows rising to a new record level of \$253 billion, mainly as a result of outward expansion by Asian TNCs. FDI inflows into South-East Europe and the CIS also surged, increasing by 50%, to reach \$86 billion in 2007. The region has thus seen seven years of uninterrupted growth. Outflows from this region similarly soared, to \$51 billion, more than twice the 2006 level. Among developing and transition economies, the three largest recipients were China, Hong Kong (China) and the Russian Federation.

...driven by record values of cross-border M&As.

Continued consolidation through cross-border mergers and acquisitions (M&As) contributed substantially to the global surge in FDI. In 2007, the value of such transactions amounted to \$1,637 billion, 21% higher than the previous record in 2000. Thus, overall, the financial crisis, starting with the sub-prime mortgage crisis in the United States, did not have a visible dampening effect on global cross-border M&As in 2007. On the contrary,

in the latter half of 2007 some very large deals took place, including the \$98 billion acquisition of ABN-AMRO Holding NV by the consortium of Royal Bank of Scotland, Fortis and Santander – the largest deal in banking history – and the acquisition of Alcan (Canada) by Rio Tinto (United Kingdom).

The largest TNCs pursued further expansion abroad...

The production of goods and services by an estimated 79,000 TNCs and their 790,000 foreign affiliates continues to expand, and their FDI stock exceeded \$15 trillion in 2007. UNCTAD estimates that total sales of TNCs amounted to \$31 trillion – a 21% increase over 2006. The value added (gross product) of foreign affiliates worldwide represented an estimated 11% of global GDP in 2007, and the number of employees rose to some 82 million.

The universe of TNCs is expanding. Manufacturing and petroleum companies, such as General Electric, British Petroleum, Shell, Toyota and Ford Motor, retain some of the top positions in UNCTAD's ranking of the 25 largest non-financial TNCs in the world. However, TNCs in services, including in infrastructure, have become increasingly prominent during the past decade: 20 of them featured among the top 100 in 2006, compared with only 7 in 1997.

The activities of the 100 largest TNCs increased significantly in 2006, with foreign sales and foreign employment almost 9% and 7% higher than in 2005, respectively. Growth was particularly high for the 100 largest TNCs from developing countries: in 2006, their foreign assets were estimated at \$570 billion – a 21% increase over 2005. Their countries of origin have changed little over the past 10 years, with companies from East and South-East Asia dominating the list of the top 25 such TNCs.

....while sovereign wealth funds are emerging as new actors on the FDI scene.

A new feature of global FDI is the emergence of sovereign wealth funds (SWFs) as direct investors. Benefiting from a rapid accumulation of reserves in recent years, these funds (with \$5 trillion assets under management) tend to have a higher risk tolerance and higher expected returns than traditional official reserves managed by monetary authorities. Although the history of SWFs dates back to the 1950s, they have attracted global attention only in recent years following their involvement in some large-scale cross-border M&A activities and their major capital

injections into some troubled financial institutions in developed countries.

While the amounts invested by SWFs in the form of FDI remain relatively small, they have been growing in recent years. Only 0.2% of their total assets in 2007 were related to FDI. However, of the \$39 billion investments abroad by SWFs over the past two decades, as much as \$31 billion was committed in the past three years. Their recent activities have been driven by the rapid build up of reserves generated by export surpluses, changes in global economic fundamentals and new investment opportunities in structurally weakened financial firms.

Almost 75% of the FDI by SWFs has been in developed countries, with investments in Africa and Latin America very limited so far. Their investments have been concentrated in services, mainly business services.

Investments by SWFs in the banking industry in 2006-2007 were generally welcomed, owing to their stabilizing effect on financial markets. However, they also prompted some negative public sentiment, with calls to impose regulatory restrictions on investments by these funds, notably on national security grounds. International institutions, such as the International Monetary Fund (IMF) and the Organisation for Economic Co-operation and Development (OECD), are in the process of establishing principles and guidelines relating to FDI by SWFs.

Most national policy changes continued to encourage FDI, though less favourable measures became more frequent.

Despite growing concerns and political debate over rising protectionism, the overall policy trend remains one of greater openness to FDI. UNCTAD's annual survey of changes in national laws and regulations that may influence the entry and operations of TNCs suggests that policymakers are continuing in their efforts to make the investment climate more attractive. In 2007, of the almost 100 policy changes identified by UNCTAD as having a potential bearing on FDI, 74 aimed at making the host country environment more favourable to FDI. However, the proportion of changes that were less favourable to FDI has been increasing over the past few years.

As in 2006, most of the new restrictions introduced were concentrated in the extractive industries, particularly in Latin America (e.g. Bolivia, Ecuador and the Bolivarian Republic of Venezuela), but they were also apparent in other countries as well. Several governments, including those of the United

States and the Russian Federation, adopted stricter regulations with regard to investments in projects that have potential implications for national security. Government concerns also appear to be directed towards investments in certain infrastructure areas and those undertaken by State-owned entities.

The number of international investment agreements (IIAs) continued to grow, reaching a total of almost 5,600 at the end of 2007. There were 2,608 bilateral investment treaties (BITs), 2,730 double taxation treaties (DTTs) and 254 free trade agreements (FTAs) and economic cooperation arrangements containing investment provisions. The shift in treaty-making activity from BITs towards FTAs continued, as did the trend towards renegotiation of existing BITs.

The global financial crisis had a limited impact on FDI flows in 2007, but will begin to bite in 2008.

The sub-prime mortgage crisis that erupted in the United States in 2007 has affected financial markets and created liquidity problems in many countries, leading to higher costs of credit. However, both micro- and macroeconomic impacts affecting the capacity of firms to invest abroad appear to have been relatively limited so far. As TNCs in most industries had ample liquidity to finance their investments, reflected in high corporate profits, the impact was smaller than expected. At the macroeconomic level, developed-country economies could be affected both by the slowdown of the United States economy as well as by the impact of the turmoil in the financial markets on liquidity. As a result, both inflows to and outflows from these countries may decline. On the other hand, the relatively resilient economic growth of developing economies may counteract this risk.

In addition to the credit crunch in the United States, the global economy was also affected by the significant depreciation of the dollar. While it is difficult to isolate the effects of exchange rate changes from other determinants of FDI flows, the sharp weakening of the dollar helped to stimulate FDI to the United States. European FDI to the United States was spurred by the increased relative wealth of European investors and reduced investment costs in the United States. Moreover, companies exporting to the United States have suffered from the exchange rate changes, which have induced them to expand local production in the United States. This is illustrated by changes in the strategy of several European TNCs, particularly

carmakers, that plan to build new or expand existing production facilities in that country.

The slowdown in the world economy and the financial turmoil have led to a liquidity crisis in money and debt markets in many developed countries. As a result, M&A activity has begun to slow down markedly. In the first half of 2008, the value of such transactions was 29% lower than that in the second half of 2007. Corporate profits and syndicated bank loans are also declining. Based on available data, estimated annualized FDI flows for the whole of 2008 are expected to be about \$1,600 billion, representing a 10% decline from 2007. Meanwhile, FDI flows to developing countries are likely to be less affected. UNCTAD's *World Investment Prospects Survey, 2008–2010*, while also suggesting a rising trend in the medium term, points to a lower level of optimism than was expressed in the previous survey, and to more caution in TNCs' investment expenditure plans than in 2007.

In Africa, high commodity prices and rising profitability attracted FDI.

In Africa, FDI inflows grew to \$53 billion in 2007 – a new record. Booming commodity markets, rising profitability of investments – the highest among developing regions in 2006–2007 – and improved policy environments fuelled inflows. LDCs in Africa also registered another year of growth in their FDI inflows. A large proportion of the FDI projects launched in the region in 2007 were linked to the extraction of natural resources. The commodity price boom also help Africa to maintain the relatively high level of outward FDI, which amounted to \$6 billion in 2007.

Despite higher inflows, Africa's share in global FDI remained at about 3%. TNCs from the United States and Europe were the main investors in the region, followed by African investors, particularly from South Africa. TNCs from Asia concentrated mainly on oil and gas extraction and infrastructure. Prospects for increased FDI inflows in 2008 are promising in light of the continuing high prices of commodities, large projects already announced for that year and forthcoming payments from previously concluded cross-border M&As. This will signify a fourth consecutive year of FDI growth. The UNCTAD survey shows that almost all TNCs have maintained or even increased their current levels of investment in Africa.

In South, East and South-East Asia and Oceania, both inward and outward FDI flows rose to their highest levels ever.

FDI flows to South, East and South-East Asia and Oceania were also higher than ever before, reaching \$249 billion in 2007. Most subregions and economies, except Oceania, received higher inflows. A combination of favourable business perceptions, progress towards further regional economic integration, improved investment environments and country-specific factors contributed to the region's performance. China and Hong Kong (China) remained the two top destinations within the region as well as among all developing economies. Meanwhile, India – the largest recipient in South Asia – and most member countries of the Association of Southeast Asian Nations (ASEAN) also attracted larger inflows, as did post-conflict countries and Asian LDCs, such as Afghanistan, Cambodia, Sri Lanka and Timor-Leste.

Overall, prospects for new FDI to the region remain very promising. Sustained economic growth, demographic changes, favourable business sentiments and new investment opportunities were among the main factors contributing to the region's good performance in 2007, and they should continue to attract FDI in the near future.

FDI outflows from South, East and South-East Asia also reached a new high, amounting to \$150 billion, reflecting the growing importance of developing countries as outward investors. Intra- and inter-regional flows are a particularly important feature. But firms are investing in developed countries as well, not least through cross-border M&As. SWFs from the region have emerged as significant investors, contributing to the region's rapidly growing outward FDI stock: this jumped from \$1.1 trillion in 2006 to \$1.6 trillion in 2007.

West Asia also saw record flows in both directions...

FDI in West Asia rose by 12% to \$71 billion, marking a new record and a fifth consecutive year of growth. More than four fifths of the inflows were concentrated in three countries: Saudi Arabia, Turkey and the United Arab Emirates, in that order. A growing number of energy and construction projects, as well as a notable improvement in the business environment in 2007, attracted FDI into members of the Gulf Cooperation Council (GCC). For example, Qatar experienced a significant rise in inflows – more than seven times higher than in 2006.

FDI outflows from the region in 2007 increased for the fourth consecutive year, to \$44 billion –

nearly six times its level in 2004. The GCC countries (Kuwait, Saudi Arabia, the United Arab Emirates, Qatar, Bahrain and Oman, in that order) accounted for 94% of these outflows, reflecting in part their desire to diversify away from oil and gas production through investments by SWFs. Intraregional FDI was significant, particularly from oil-rich countries, as confirmed by a growing number of greenfield projects and the increasing value of cross-border M&As.

FDI inflows into West Asia are expected to rise in 2008, as countries in the region have remained largely unaffected by the sub-prime mortgage crisis, and a significant number of intraregional investment projects are in the pipeline.

... while the surge of FDI into Latin America and the Caribbean was mainly driven by the demand for natural resources.

Latin America and the Caribbean saw inflows rise by 36% to a historic high of \$126 billion. The increase was the highest in South America (66%), where most of the \$72 billion worth of inflows targeted the extractive industries and natural-resource-based manufacturing. Inflows to countries in Central America and the Caribbean (excluding offshore financial centres) increased by 30% to \$34 billion, despite the economic slowdown in the United States. This resilience was partly explained by the dynamism of FDI in mining, steel and banking, which are not oriented primarily towards the United States market.

FDI outflows from the region fell by 17% to \$52 billion, mainly reflecting a return to more “normal” levels of outward investment from Brazil. Latin American TNCs, mainly from Mexico and Brazil, continued to internationalize, competing for leadership in such industries as oil and gas, metal mining, cement, steel, and food and beverages. In addition, many new Latin American companies began emerging in new sectors such as software, petrochemicals and biofuels.

In the extractive industries, in which FDI increased as a result of the high commodity prices, the picture differed between oil and gas and metal mining. In metal mining, the scope for inward FDI is greater, as there are no major State-owned companies in the region, except Codelco in Chile. In oil and gas, by contrast, the dominant position, or even exclusive presence, of State-owned oil and gas companies limits the opportunities for foreign investors. This situation was accentuated in 2007, as a number of countries, including Bolivia, the Bolivarian Republic of Venezuela and Ecuador, adopted policy changes to increase taxation and further restrict or prohibit foreign investment in oil and gas.

FDI to and from Latin America and the Caribbean is expected to increase further in 2008. Inflows would be driven mainly by South America, where high commodity prices and strong subregional economic growth should continue to boost TNCs' profits. However, the level of future inflows into Central America and the Caribbean is uncertain, as the slowdown of the United States economy and a weak dollar could adversely affect their export-oriented manufacturing activities. Outflows are expected to be boosted by TNCs in Brazil and Mexico, which have already announced ambitious investment plans for 2008.

FDI to and from South-East Europe and the Commonwealth of Independent States maintained an upward trend and set new records.

As in most other regions, inflows to and from South-East Europe and the CIS reached unprecedentedly high levels. Inward FDI rose for a seventh consecutive year, to reach \$86 billion – 50% more than in 2006. In the CIS, these inflows were mainly attracted to fast growing consumer markets and natural resources, while those to South-East Europe were associated with privatizations. Inward FDI in the Russian Federation increased by 62%, to \$52 billion.

Outward FDI from South-East Europe and the CIS amounted to \$51 billion, more than double its 2006 level. FDI from the Russian Federation – the main source country in the region – soared to \$46 billion in 2007. Russian TNCs have extended their reach to Africa with the aim of increasing their raw material supplies and their access to strategic commodities. These are needed to support their efforts to increase their downstream presence in the energy industry and their value-added production activities in the metals industry of developed countries.

Whereas most of the national policy changes of the transition economies in 2007 were in the direction of greater openness to FDI, some CIS countries continued to introduce restrictions in the extractive industries and some other strategic industries. The Russian Federation approved the long-discussed Strategic Sector Law, which specifies industries in which foreign investors are allowed only minority

participation. In Kazakhstan, a newly approved natural resources law allows the Government to change existing contracts unilaterally if they adversely affect the country's economic interests in the oil, metal and mineral industries. Nevertheless, FDI flows are expected to be buoyant in these two countries as well as Ukraine.

In developed countries FDI inflows and outflows appear to have peaked.

Despite concerns over the economic uncertainty faced by some developed economies, FDI inflows to developed countries as a whole surged by 33% in 2007, to reach \$1,248 – yet another record. The rise was mainly driven by cross-border M&As, but also by reinvested earnings as a result of high profitability of foreign affiliates. The United States retained its position as the world's largest FDI recipient country. The restructuring and concentration process in the enlarged common market of the EU countries led to a renewed wave of cross-border acquisitions. Large FDI flows to the United Kingdom, France, the Netherlands and Spain drove overall FDI inflows to the EU to \$804 billion – a 43% increase. Japan's FDI inflows grew strongly for the first time since the end of the 1990s.

Developed countries maintained their position as the largest net outward investors, as outflows soared to a record \$1,692 billion. The largest outward investors – the United States, the United Kingdom, France, Germany and Spain (in that order) – accounted for 64% of the total outward FDI of the group.

The policy environment for FDI in a number of developed countries continues to be one of greater openness, with some exceptions. There are, however, growing concerns over the possible negative effects of cross-border investments by SWFs, as well as private equity and hedge funds.

FDI to and from developed countries is expected to fall because of the dampening effects of the financial market crisis, combined with weaker economic growth in these economies. The value of cross-border M&As in developed countries fell considerably in the first half of 2008, compared with the second half of 2007. In UNCTAD's *World Investment Prospects Survey 2008–2010*, 39% of the responding TNCs anticipated an increase in FDI inflows into developed countries compared with more than 50% in last year's survey.

TRANSNATIONAL CORPORATIONS AND THE INFRASTRUCTURE CHALLENGE

There are huge unmet investment needs for infrastructure in developing countries.

The provision of good quality infrastructure is a prerequisite for economic and social development. Indeed it is considered one of the main preconditions for enabling developing countries to accelerate or sustain the pace of their development and achieve the Millennium Development Goals (MDGs) set by the United Nations.

Moreover, the future investment needs of developing countries in infrastructure far exceed the amounts being invested by governments, the private sector and other stakeholders, resulting in a significant financing gap. On average, according to World Bank estimates, developing countries currently invest annually 3–4% of their GDP in infrastructure; yet they would need to invest an estimated 7–9% to achieve broader economic growth and poverty reduction goals.

Partly because of the scale of investment required in infrastructure, there has been a fundamental change in the role of the State around the world. Governments have opened infrastructure industries and services up to much greater involvement by the private sector – including TNCs. After the Second World War, and until the 1980s, infrastructure industries were by and large the purview of the State, sometimes through corporatized forms, such as State-owned enterprises (SOEs). Since then they have been gradually liberalized, though the pace and degree have varied by industry and country. As a result, the relationship between the State and the private sector has evolved, with the State increasingly assuming the role of regulator of activities performed by private, and often foreign, companies. This new relationship will continue to change in response to technological progress, growing experience with private sector involvement and shifting political priorities.

In addition to developing-country TNCs in infrastructure (mentioned below), “new players” in infrastructure have emerged including a heterogeneous set of institutions belonging to two broad groups: private equity investors, and State-owned or Government-linked entities such as sovereign wealth funds.

WIR08 focuses on economic infrastructure, including electricity, telecommunications, water and sewage, airports, roads, railways and seaports

(the last four collectively referred to as transport). Analyses of TNC activities, development effects and policy recommendations need to take into account the main features of these industries. First, infrastructure investments are typically very capital-intensive and complex. Second, infrastructure services often involve (physical) networks, and are frequently oligopolistic or monopolistic in nature. Third, many societies regard access to infrastructure services as a social and political issue. Such services may be considered public goods, in the sense that they should be available to all users, and some, such as water supply, are considered a human right. Fourth, infrastructure industries are a major determinant of the competitiveness of an economy as a whole, and the quality of infrastructure is an important determinant of FDI. Fifth, infrastructure is key to economic development and integration into the world economy.

TNC participation in infrastructure has increased substantially, including in developing and transition economies.

Infrastructure industries account for a rapidly expanding share of the stock of inward FDI. Over the period 1990–2006, the value of FDI in infrastructure worldwide increased 31-fold, to \$786 billion, and that in developing countries increased 29-fold, to an estimated \$199 billion. Throughout the period it continued to grow in most infrastructure industries, but most significantly in electricity and telecommunications, and much less in transport and water. As a whole, the share of infrastructure in total FDI stock globally currently hovers at close to 10% compared to only 2% in 1990.

Another measure, foreign investment commitments in private participation in infrastructure (PPI) projects (which include FDI, but also other investments that are an element of concessions), also indicates that TNCs have invested significantly in developing countries. During the period 1996–2006 such commitments amounted to about \$246 billion, with a concentration in Latin America and the Caribbean between 1996 and 2000 (the region accounted for 67% of commitments); but since the turn of the century TNC participation in PPIs has grown relatively faster in Africa and Asia.

The *group of LDCs* has remained by and large marginalized in the process of globalization

of infrastructure investment, accounting for about 2% of the stock of infrastructure FDI in developing countries in 2006. Their share in the foreign investment commitments in infrastructure industries of developing economies in the period 1996–2006 (of \$246 billion) was a little over 5%.

The form of TNC involvement varies considerably by industry. Telecommunications is the only infrastructure industry in which FDI has been the dominant form of TNC entry in developing and transition economies. In electricity concessions were the most frequent modes of entry (62% of the cases), followed by privatizations and greenfield projects (36%). Foreign participation was also predominantly in the form of concessions in transport infrastructure (more than 80%), and in water (70% of the projects). The water industry also used management and lease contracts relatively frequently (25%).

Developing-country firms are significant infrastructure TNCs and are becoming prominent investors in other developing countries.

Although developed-country TNCs still dominate in infrastructure industries internationally, there has been a marked rise involvement by developing-country TNCs. In some industries, such as telecommunications, they have emerged as major players, and in others, such as transport, they have even become world leaders. Of the top 100 infrastructure TNCs in the world in 2006, 14 were from the United States, 10 from Spain, and 8 each from France and the United Kingdom. However, of the top 100 infrastructure TNCs, no less than 22 were headquartered in a developing or transition economy. The largest number of such firms was from Hong Kong (China) with 5 firms, and Malaysia and Singapore with 3 each.

To varying degrees, TNCs from the South are playing a more prominent role in the infrastructure industries of developing countries, though they do not invest as much as their developed-country counterparts. In *Asia and Oceania*, TNC involvement from other developing economies, especially intraregional investment, is particularly pronounced. In 1996–2006 almost half of foreign investment commitments in infrastructure in Asia and Oceania originated in developing countries, and in two industries (telecommunications and transport), TNCs from the South accounted for the largest share of foreign commitments. In *Africa*, developing-country investors have been dominant in telecommunications (58% of all commitments), but are less important in other infrastructure industries. On average, developing-country firms account for

40% of all commitments in Africa. Finally, in *Latin America and the Caribbean* the role of developing-country investors has been more limited (16% of private commitments). (Note that “all commitments” include any made by the State or SOEs where they have a share in PPI projects. However, investments in infrastructure made solely by the State or SOEs are excluded.)

TNCs in infrastructure derive their competitive advantages from a variety of sources and invest abroad mostly to access markets.

Competitive or ownership advantages of infrastructure TNCs are primarily related to specialist expertise or capabilities, such as network design and operation, engineering skills, environmental know-how, project management capabilities and tacit, hands-on skills. Specialized business models and financial prowess are important in some industries and segments, such as telecommunications.

The majority of infrastructure TNCs invest abroad in order to access the markets of host economies. They aim at benefiting from market opportunities arising from a number of sources, including the liberalization and deregulation in host economies, invitations to tenders for infrastructure projects, and the opening up of host countries to foreign acquisition of local firms (including privatization and acquisition of private firms). Additional motivations for investment can include following clients in the infrastructure business, searching for economies of scale and taking advantage of regional growth opportunities. The primacy of the host country market as a motive for infrastructure TNC involvement in developing economies places LDCs at a disadvantage in attracting them, as they have small markets in general and in infrastructure industries more specifically.

TNCs' mobilization of financial resources for infrastructure investment is rising, but a vast gap remains.

Financial constraints faced by governments were a major reason for an increasing number of developing countries to open up to FDI and TNC participation in infrastructure industries in the 1990s. TNC participation in infrastructure in developing countries has resulted in the inflow of substantial financial resources. The stock of infrastructure FDI in developing countries, an indicator of the extent to which TNC participation mobilizes financial resources, surged after 1990, as mentioned above.

The \$246 billion foreign investment commitments in infrastructure in developing countries during 1996-2006 (also mentioned earlier) represented an average of 29% of all PPI investment commitments. This reflects the importance of TNCs' contribution to these industries in developing countries, with the highest share in Africa (36%).

Despite significant levels of TNC investment in developing-country infrastructure, more of it is required to bridge the vast financing gap: there is need for substantial amounts of additional investment, irrespective of source. For instance, in Africa, total TNC investment commitments in infrastructure during the *decade* spanning 1996-2006 were \$45 billion – an amount that is barely equivalent to the region's current *annual* infrastructure investment needs of \$40 billion.

In a similar vein, investment in infrastructure by foreign companies in the 1990s was connected with a decline in public investment in the sector across much of Latin America. In expectation of a large-scale increase in private sector investment, many countries cut back on public expenditure in infrastructure, but the increase in investment by TNCs (and the domestic private sector) did not fully compensate for this decline. An important lesson from this experience is that TNC participation should not be considered sufficient to provide for a country's investment needs in infrastructure industries; rather, it should be viewed as an important supplement and complement to domestic investments.

TNC investment in developing-country infrastructure affects industry performance ...

TNCs in infrastructure bring both hard technology (e.g. specialist equipment for water purification) and soft technology (e.g. organizational and managerial practices) to their operations in host countries. As regards hard technology in telecommunications, for instance market entry by international operators from both developing and developed countries has contributed to lowering the threshold of access to and usage of information and communication technologies for developing countries. TNCs also transfer soft technology to host-country operations, for instance by re-engineering operational processes, improving procurement and subcontracting practices, and enhancing client records and collection methods. Overall, studies show that in a number of cases the introduction of hard and soft technology by foreign affiliates has helped enhance productivity in services provision, as well as its reliability and quality. However context matters, and performance gains as a consequence of TNC (and more generally

private) involvement depend very much on a well-defined regulatory environment.

The industry-wide impact of technology transfer by TNCs also depends on the diffusion of technology to other firms in the industry through a number of routes of transmission, including joint ventures, mobility of personnel and demonstration effects. For instance, in China's electricity generation industry, TNC participation in large joint-venture projects has involved systematic and comprehensive project management cooperation between foreign investors and their Chinese counterparts. This has enabled the latter to enhance their expertise and efficiency. For the effective diffusion of technology from infrastructure TNCs, the existence of capable domestic enterprises is essential.

The higher the contestability of an infrastructure industry, the more likely it is that TNC participation will contribute to enhanced efficiency through increased competition. For example, in many countries, a competitive market structure has been established in telecommunications as a consequence of technological change and industry reforms. In Uganda, for instance, competition between the national provider and TNCs led to price reductions and a rapid increase in penetration of mobile telephony. Cross-country studies have shown the complementarities between privatization and competition: competition increases the gains from privatization, and vice versa.

On the other hand, in water supply, which is an example of an industry that is still essentially a natural monopoly, the entry of TNCs can result in State monopolies being turned into private, foreign-owned monopolies. This limits competition and thus the scope for efficiency enhancement. In other services, while the entry of TNCs can increase competition and thus efficiency, it may also pre-empt the entry of domestic players or crowd out existing ones. In electricity and telecommunications – both relatively contestable industries – the experience of a number of developing countries indicates that infrastructure TNCs can in some cases be associated with anti-competitive behaviour.

In some developing countries, where domestic capabilities exist, local private participants can enhance their competitiveness and efficiency by collaborating with TNCs in a variety of ways. For example partial privatization, with minority ownership participation by TNCs, has been implemented by developing countries such as Morocco in telecommunications, with favourable results for competition. As an alternative to TNC involvement, some developing countries have also been able to improve the performance of public utilities through corporatization reforms without

direct TNC participation. However, successful cases are mainly in relatively high-income or large developing economies.

...with implications for the provision of infrastructure services and universal access.

The participation of TNCs has generally increased the supply and improved the quality of infrastructure services in host countries, but their impact on prices has varied. In some instances this has caused concern over services being priced beyond the reach of the poor. In particular, the *affordability* of services is jointly determined by the price of services and the disposable income of consumers in an economy. The impact of TNC participation on access to services can thus differ among segments of a society: improvements in industry performance do not necessarily translate into increased availability and affordability of services for all members of a society, especially the poor and people living in rural, remote and economically deprived areas.

Improvements in supply, coverage of services, price and access as a result of TNC participation in developing countries are more pronounced in *telecommunications* than in any other infrastructure industry, especially in mobile telephony. Many developing countries have experienced a “mobile revolution”: new business models introduced by TNCs have enabled the expansion of mobile services into low-income segments. TNC entry into the *transport* industry of developing countries is far more varied than in other areas. International terminal operators, for instance, have considerably improved the quality of services in major ports and thereby increased developing-country connectivity to the global economy.

In contrast to telecommunications, and to a lesser extent transport, the impact in electricity and water has been mixed. The impact of TNC participation on prices, and thus access to electricity and water, depends on political, social and contractual issues, as well as productivity and efficiency gains. In the absence of government subsidies to users, additions to supply capacity and productivity and efficiency improvements may be insufficient to maintain low prices while covering costs. Prices can continue to be subsidized after entry by the private sector, although countries sometimes raise tariffs both to attract companies and to reduce subsidies.

Evidence from a number of developing countries suggests that greater private sector investment – often with TNC involvement – has in many cases led to increased supply capacity and

network connections in *electricity*, and thereby to steady improvements in the reliability and quality of service in the industry. Given the many factors involved, electricity prices have sometimes fallen after TNC entry, but overall there has been no definite trend in prices, up or down. The impact of TNC participation on users’ access to *water* has been disappointing in many cases, though there is some evidence that well-designed schemes for TNC participation have led to significant service expansion. Partly because TNC participation has sometimes not met expectations of improved access, there have been cancellations of water concessions in countries such as Argentina, Bolivia and the Philippines.

In summary, in the telecommunications and transport industries, TNCs have contributed substantially to making services more affordable and accessible. For those services that are considered essential, such as drinking water, if the efficiency improvements achieved by TNCs *cannot* allow them to maintain prices at low levels while covering costs, and the government does not provide subsidies to users, access for the poor is affected. Government policies are critical for all infrastructure industries, but, from a social perspective, more so in the case of electricity and water.

Leveraging TNC participation is a complex policy challenge.

Host countries need to consider when it is appropriate to draw TNCs into the development and management of infrastructure. They also need to find ways of ensuring that projects with TNC involvement lead to the expected development effects. This is a complex policy challenge.

As policy priorities and options vary between countries, so too does the optimal mix of public and private (including TNC) investment. Designing and implementing appropriate policies to harness the potential role of TNCs in infrastructure require adequate skills and capabilities. Governments need to prioritize among competing demands for different projects, establish clear and realistic objectives for the projects chosen, and integrate them into broader development strategies. This means that government agencies have to possess the necessary institutional capacity and skills to guide, negotiate, regulate and monitor the projects. This applies not only at the central level, but also in provincial and municipal governments.

While many developing countries seek foreign investment to develop their physical infrastructure, convincing foreign companies to invest has in many cases become even more challenging. Growing demand in the developed world and in large emerging

economies is leading potential investors to expect higher returns for a given level of risk. This poses a particular problem where large-scale capital investments are needed up-front, where cost-recovery is difficult to achieve and where social concerns are considerable. Project failures and multiple investment disputes have furthermore contributed to a more cautious attitude towards infrastructure projects among overseas investors.

Countries seek greater TNC involvement in infrastructure, but openness varies by industry.

The trend towards opening has been more widespread among developed countries and the relatively advanced developing and transition economies. While the nature of liberalization has varied, all groups of countries are now more welcoming to TNC activities in infrastructure than they were two decades ago.

However, there are significant variations by industry. Openness is the highest in mobile telecommunications, and the lowest in water. Countries are generally more open to TNC involvement in industry segments that are relatively easy to unbundle and expose to competition. Openness also appears to be greater in countries with more developed institutional and regulatory capabilities. At the same time, some governments are becoming more careful about allowing foreign companies to take control of certain infrastructure, including power generation and distribution, port operations and telecommunications. New restrictions have been proposed based on national security or public interest concerns.

These concerns notwithstanding, many countries have moved beyond the removal of barriers to TNC involvement, and are actively promoting it in some areas of infrastructure. Many investment promotion agencies (IPAs) are targeting infrastructure industries. In a survey conducted by UNCTAD and the World Association of Investment Promotion Agencies, about 70% of the IPA respondents stated that they were actively seeking such investment, while only 24% were not. Almost three quarters of the IPAs stated that infrastructure is a more important priority than it was five years ago.

Confirming the broad patterns of openness to TNC involvement, the infrastructure industries most often targeted by IPAs are electricity generation, Internet services and airports. By contrast, the lowest number of IPAs targeted electricity distribution and transmission. Judging from the patterns of investment in LDCs, there may be a case for low-income countries to target TNCs from other developing countries, especially in transport infrastructure.

Securing development gains requires an appropriate governance framework and strong government capabilities.

Without an adequate institutional and regulatory framework, the risk increases that countries will lose out by opening up to TNC participation. Moreover, once a country liberalizes, it is often hard to reverse the process. This is why the sequencing of reforms is important. Ideally, competitive restructuring, the introduction of regulations and the establishment of an independent regulatory agency should precede steps towards opening up. Such a sequence helps clarify the rules of the game for potential investors and makes governments better prepared for engaging in a specific project. However, in reality, opening up to foreign investment has often preceded comprehensive reform, with less positive outcomes as a result. Until credible regulatory bodies can be established, developing countries are likely to be better off keeping their utilities in the public sector.

Inviting TNCs to deliver infrastructure services tends to place more, rather than less, responsibility on public officials. Infrastructure investments typically require the negotiation of contracts between the host country and the foreign investor(s). Contracts provide for a tailor-made agreement that responds to the particular requirements of each project and the intentions of the contracting parties. It is therefore important for countries to develop the expertise to determine the desirable level and forms of TNC involvement, to negotiate and monitor the implementation of projects.

Due to asymmetries of information and experience between a TNC and a host-country government, it is generally difficult for public sector staff to match the resources of the private sector when engaging in contract negotiations. Major TNCs tend to make use of international law firms and other experts specializing in project finance transactions, but this is not always possible for developing countries.

If countries with limited experience decide to involve TNCs in infrastructure projects, it may be advisable for them to start on a small scale rather than adopting a major programme across industries. It may also be useful for them initially to concentrate on less contentious segments of an industry.

Many investment disputes are related to infrastructure.

An issue that has attracted increased attention in recent years is the rise of disputes related to infrastructure investments. At the end of 2007, some 95 disputes (or one third of all known treaty-based investor-State disputes) were related to electricity,

transportation, telecommunications, water and sanitation. The disputes have provoked debate over the implications of international investment agreements (IIAs), and especially BITs.

One side of this debate is concerned that improved protection and certainty for foreign investors has come at the price of too much reduction in the government's regulatory flexibility. It argues that the possibility of investor-State arbitration may have a dampening effect on States' ability to adopt public welfare regulations and other regulations in their citizens' interests. The other side questions whether BITs have been, or ever will be, able to provide the protection they were originally intended to offer investors. TNCs that have seen their cases dismissed or received far lower compensation than what they had claimed will have found that the protection offered through the BITs was less comprehensive than expected.

A review of arbitration decisions shows that less than half of the awards rendered favoured the claimant, and that damages awarded were considerably smaller than the total claims made by investors. The fact that more than 90 known disputes concerned infrastructure shows that concluding IIAs (and the coexistence of IIAs and State contracts) can have significant implications for host States. At the same time, the number of disputes should be seen in the light of the several thousands of IIAs, and a huge number of investment projects in infrastructure. In addition, if renegotiations of contracts are successful, they do not reach the stage of dispute and arbitration. The complexity of related issues, together with the dynamic evolution of the IIA universe and the international case law, underline the importance of capacity-building to ensure that developing-country governments understand the implications of concluding IIAs. They also need to be better equipped to handle potential investment disputes.

Stronger commitments from the international community is needed ...

It is important to consider the potential role of home countries and the international community in facilitating more foreign investments into countries that seek such inflows. This is particularly relevant from the perspective of low-income countries, which lack domestic capabilities and have generally failed to attract significant TNC involvement in infrastructure.

Without some form of subsidies, it is difficult to attract TNC investment into economies, communities and industry segments that are characterized by weak purchasing power and poor records of payment. In these cases, development finance institutions can act

as catalytic financiers. Especially in such industries as electricity, water and transport, there is significant potential for synergies between foreign investment and overseas development assistance (ODA). By making more funds available, development partners and the home countries of the investing firms could play a major role in helping to "crowd in" foreign investment into infrastructure projects in developing countries.

While development partners have recently scaled up their ODA commitments to infrastructure, current levels of support have not recovered from the earlier period of declining lending by multilateral banks, and they have not reached the levels promised in various international forums. Moreover, while development partners are yet to provide all the funds pledged to scale up infrastructure investments in low-income countries, existing funds are not being fully used – a situation that can be referred to as the "infrastructure paradox". Recent assessments show that the liquidity of development finance institutions is very high.

Development partners should honour their commitments related to ODA for infrastructure. Institutions that provide bilateral or multilateral development finance also need to become more willing to take risk and to allocate a greater share of their activities to the needs of low-income countries. In addition, they should keep all options open. While a strong case can often be made for facilitating greater involvement of the private sector, including TNCs, other approaches should not be ruled out. In some projects, notably in water and some electricity segments, there may be strong arguments for keeping the operation of the services in public hands. But also in other industries, weak institutional capabilities may make private-sector involvement too risky. In such situations, international efforts focused on supporting existing public sector producers may be more appropriate. Development partners should therefore give sufficient attention to financing infrastructure projects for which it may not be possible to mobilize private sector involvement.

...including to mitigate risk and build capacity in low-income countries.

Risk-mitigation measures by home countries and international organizations can help in the short term to mobilize private financing of infrastructure projects in developing and transition economies. Special attention may have to be given to measures aimed at mitigating three broad types of risk: political risk (including sub-sovereign and contractual and regulatory risks), credit risk and exchange-rate risks.

Despite the plethora of risk-mitigation instruments available, current programmes are insufficiently tailored to the situation of low-income countries. For example, local currency financing by development finance institutions typically requires a well-established currency swap market. Where such a market exists, intervention by development finance institutions is less likely to be needed. At the same time, risk-mitigation instruments should not be seen as a panacea. Too much risk mitigation may lead to problems of moral hazard and encourage reckless risk-taking on the part of investors and lenders. While risk-mitigation tools can facilitate the mobilization of private debt and equity, they do not make poorly structured projects more viable. This underscores the importance of capacity-building efforts.

Such efforts are especially important in LDCs. Depending on the specific circumstances of each country, assistance may need to be provided for developing legal and regulatory frameworks, assessing different policy and contractual options, preparing project proposals, and monitoring and enforcing laws, regulations and contracts. Considering the nature of the projects, governments at all levels – national, provincial and municipal – are in urgent need of assistance. While positive steps have been taken to meet these needs, current efforts remain vastly insufficient. Disturbingly, funds available for capacity-building are not always fully used.

Advisory services should be geared to provide advice not only on how to encourage investment, but also on how infrastructure can be made to fit into larger development plans and objectives. Most

capacity-building support is currently provided by different financing institutions that often have a direct stake in the different projects. It would be worth exploring a more active role for the United Nations in this context. As a neutral party, the organization could complement existing players by, for example, helping developing-country governments in evaluating infrastructure contracts and developing negotiating skills. Improving the ability of governments in these areas should help secure greater development gains from investment inflows.

* * *

The development of physical infrastructure remains one of the most urgent areas for policymakers to address. The needs are huge, and meeting them will require greater use of the private sector, including TNCs. This applies particularly to LDCs, where infrastructure improvements are critical to their attainment of the MDGs. At the same time, low-income countries are often poorly equipped to both attract TNCs into infrastructure and maximize the benefits from TNC involvement. Whatever mix of private and public sector involvement is chosen, adequate institutions and enforcement mechanisms are essential to ensure efficient and equitable delivery of infrastructure services. Meeting the infrastructure challenge requires a concerted effort by all relevant parties. This implies an appropriate combination of improved governance and capabilities in host countries, greater support from the international community and responsible behaviour on the part of the investors.

Geneva, July 2008

Supachai Panitchpakdi
Secretary-General of the UNCTAD
