GE.03-52747
INTRODUCTION

1. The General Assembly of the United Nations, at its fifty-seventh session, discussed commodity issues under agenda item 84 (b), “Macroeconomic policy questions: commodities”. The General Assembly had before it document A/57/381, entitled “World Commodity Trends and Prospects: Note by the Secretary-General”, which had been prepared by the UNCTAD secretariat.

2. Following its discussion on this item, the General Assembly adopted resolution 57/236 which, in its paragraph 11: “Calls upon the Secretary-General of the United Nations Conference on Trade and Development, within existing budgetary resources, supplemented by voluntary contributions as appropriate, to designate independent eminent persons to examine and report on commodity issues, including the volatility in commodity prices and declining terms of trade and the impact these have on the development efforts of commodity-dependent developing countries, for consideration by the Trade and Development Board at its executive session and, subsequently, by the General Assembly at its fifty-eighth session”. For this activity, the budgetary resources of UNCTAD were supplemented by one voluntary contribution amounting to $10,200, received from the Government of Italy.

3. The designated eminent persons (listed in the annex) met on 22 and 23 September 2003 at the Palais des Nations in Geneva. The meeting was opened by the Secretary-General of UNCTAD and chaired by the Deputy Secretary-General of UNCTAD and the Director of the Division on International Trade in Goods and Services, and Commodities. Nine brief background notes were prepared by the secretariat, covering the issues that were expected to be taken up by the eminent persons. These are available to the Trade and Development Board in their original unedited English versions.

4. Based on their discussions, as summarized in part III of this report, the eminent persons agreed upon a set of recommendations which are presented in part II.
I. RECOMMENDATIONS

5. We believe that there is a wide range of actions which can improve the conditions on commodity markets and which can help alleviate the poverty of many commodity producers, including through better crop management systems. We have separated these proposals into short-term ones, involving urgent, immediate action in response to severe crises, with immediate discernible results; medium-term ones, involving a reorientation of policies and proposals that is eminently feasible; and long-term ones, the discussions on which should be started now but implementation of which could take time. Among the recommendations given below, we would like to draw particular attention to our proposals in the following areas, to which we attach the highest priority:

- Enhanced, equitable and predictable market access for commodities of key importance to developing countries (recommendation 1);
- Addressing the problems of oversupply for many commodities (recommendations 2 and 7);
- Making compensatory financing schemes user-friendly and operational (recommendation 4);
- Strengthening capacity and institutions (recommendations 8 and 9);
- Pursuing the possibilities for the creation of a new International Diversification Fund (recommendation 15).

A. Short-term recommendations

1. WTO negotiations

6. We note with concern the inability of WTO members to come to an agreement at the 5th WTO Ministerial Conference in Cancún. We need to make urgent progress on issues such as removal of market access and entry barriers to developing country commodity exports (e.g. tariff escalation), as well as problems relating to SPS, TBT and rules of origin. Developing countries are currently the victims of subsidy policies in the developed countries, and the likely delay in international trade liberalization in this area will thus negatively affect their economic growth. It will be particularly harmful for the producers of many agricultural commodities, who are facing unfair competition from developed country farmers. We call for a speedy resumption of the trade negotiations, which offer the best opportunity to tackle these issues.

7. Meanwhile, however, there is need for action to compensate developing country farmers for the losses that they suffer as a result of current developed country policies. In line with the proposal by four African countries at the WTO Ministerial Meeting at Cancún, we call for an early elimination of subsidies provided in developed countries to cotton and for the compensation of the loss of earnings due to the supplies of cotton subject to subsidies. We call upon the international community to prioritize research on the modalities for such a compensation mechanism, working with expert organizations such as UNCTAD. We also call for further work on the appropriateness of extending the model of the “cotton initiative” to other relevant commodities.
8. Agricultural subsidies in other countries can negatively impact on a developing country's commodity production if they lead to the import of subsidized commodities, constraining the output of its farmers and hindering expansion and diversification possibilities. A special mechanism to enable affected developing countries to safeguard against such imports is of crucial importance.

2. Coffee

9. We note with dismay the extreme poverty into which 25 million coffee farmers and workers have been thrust by very low prices. We therefore call for immediate and decisive emergency action. We suggest that the International Coffee Organization (ICO) consider imposing an export fee, using the proceeds of the fee to help alleviate poverty arising from low coffee prices. We urge both producing and consuming countries as well as relevant international organizations to support such a programme and associated actions by the International Coffee Organization covering, on the supply side, quality improvement measures, promotion of diversification and production monitoring, and on the demand side, the promotion of consumption.

3. Debt relief

10. Debt servicing and repayment expenditures of many developing countries are financed by revenues from commodity exports. The prices at which these commodities are exported, however, are determined outside the country and may decline substantially without any responsibility of the country concerned, leading to severe financial strain. Many developing countries are now in no position to service their debt because of a combination of low export prices and high oil import prices. As early as possible, mechanisms should be introduced which would better tailor debt relief efforts to the needs of commodity-exporting developing countries, in particular LDCs and HIPC countries.

11. In the medium term, other mechanisms should be explored and established to address in a more systemic way the linkage between the problems of commodity-exporting developing countries and debt relief measures. We call on UNCTAD and other agencies to undertake further studies in these areas.

B. Medium-term recommendations

4. Compensatory finance

12. Compensatory finance has an important potential role in insulating developing countries from the worst effects of international price volatility, and indeed in reducing volatility. In order to be effective, such financing has to meet the following requirements:

- Operation on the basis of ex-ante rather than ex-post mechanisms (in other words, clearly linking automatic pay-outs to specific occurrences);
- Ease of access, in terms of technical requirements;
− Absence of conditionalities for receiving the finance – it should be sufficient that the
country itself carries no evident blame for the specific commodity-linked loss that it
suffered;
− The inclusion of a pass-through mechanism to actual producers and consumers.

13. The tools and mechanisms for this exist, and existing schemes should be adapted
accordingly and made operational.

5. Policy design and implementation

14. The link between the development of the commodity sector and poverty is irrefutable,
and Governments need the capacity to address these issues in their policy design and
implementation and in international negotiations. Governments should be empowered to
properly address the links between international commodity trade aspects and national
development in their policies. It would be advisable for concerned countries to consider
establishing appropriate processes and institutions involving all stakeholders to effectively
address those issues in the framework of a commodity strategy and/or a strategy for
economically and environmentally sustainable rural development. Few countries are now in a
position to have a commodity strategy; commodity issues should become an explicit part of
Poverty Reduction Strategies. We urge the international donor community to support
UNCTAD and other competent organizations in setting up capacity-building programmes and
activities in this area.

6. Corporate social responsibility

15. We recognize with satisfaction that the many private sector firms are showing
increased interest in applying principles of corporate social responsibility in their global
operations, in line with international standards and agreements. In this light we urge
individual companies to increase their efforts to incorporate concerns related to the
sustainable development of the commodity sector, the dissemination of the benefits of
commodity-related activities to the disadvantaged sections of the population, and the
generation of positive linkages with the rest of the economy in their corporate social
responsibility commitments. We think it is important that long-term thinking of companies
gains the upper hand over short-term orientation.

7. Measures for dealing with oversupply

16. Regarding commodities facing a situation of structural oversupply, a concerted effort
is necessary to bring demand and supply into balance at a point where prices are sufficiently
remunerative for the average producer. In this connection, action on both demand and supply
sides can be envisaged. In this light, we stress the large potential benefits of faster
liberalization of trade among developing countries. Measures aiming at the expansion of
demand could include improving the quality of supplies as well as identifying new end uses.
Regarding the supply side, the main objective would be to diversify into other productive
activities with better returns. Furthermore, research and development into new end-uses of
commodities should be supported. Strengthening the resources of the Second Account of the
Common Fund for Commodities to continue to provide support to the developing countries in these areas is emphasized.

17. In the short term, however, measures to reduce the supplies put on the market may be necessary. Where appropriate or feasible, these may include producer-consumer schemes, joint measures by producers only, and national-level measures. In this connection, we recognize the “free-rider” problem and the operational difficulties with supply management schemes. Producer countries that face a situation of oversupply are also encouraged to take national measures – an example is Malaysia’s use of a cess on palm oil production imposed in times of high prices, which is used in times of low prices to subsidize the use of palm oil in a non-traditional way, namely for electricity generation – as well as measures in cooperation with others that can address their predicament. Relevant institutions could be approached to organize meetings to examine the experiences in this area. Countries that are not party to such schemes should agree to apply a favourable interpretation of GATT Articles XI, XX and XXXVI, as well as other relevant articles of GATT and WTO Agreements, and to forego using competition policy measures against such schemes. Developed countries should eliminate subsidies, where feasible, to contribute to reducing oversupply.

8. Capacity building to improve supply capacities and market entry

18. Many commodity-dependent developing countries do not have the capacity to benefit from potential market openings. Support for strengthening supply capacity in the commodity sector should be made an integral part of international assistance to commodity-dependent countries. This should include policy-level support to design and implement strategies, policies and measures for commodity-based development and diversification, the improvement of domestic research and development capacities, as well as support for the organization of small-scale producers to achieve better integration into international supply chains. Encouraging and strengthening organization of small-scale producers, processors and traders of commodities with a view to enhancing their capacities for technology absorption and for marketing of their products is important. We emphasize the importance of assistance aimed at enabling small producers to meet quality and traceability requirements, as well as market exigencies reflected in the specifications of importing firms.

19. We recognize that capacity building has many different facets and that different entities such as international organizations, private companies, particularly TNCs, business associations, NGOs and the Governments of both developed and developing countries have their specific insights and competences. A holistic approach with consistency and complementarity, and based on a spirit of partnership among all the relevant actors, has a better chance of making a positive impact than a piecemeal approach. We call for an organization such as UNCTAD to be entrusted with the task of convening the different entities mentioned above so that needs of commodity-dependent countries in terms of capacity building are examined, an integrated coherent programme of capacity building is designed, its implementation followed up, and a division of labour as well as commitments are secured. The implementation of such a programme “in the field” would call for country-level arrangements, possibly led by international organizations with country presence. Donor organizations are invited to support these capacity-building activities financially.
9. **Institution building**

20. Weak institutions and weak legal and regulatory frameworks (for example, land titles, problems with ownership rights, export regulations, bankruptcy rules) not only make it difficult for farmers, other producers, processors and traders in developing countries to benefit from diversification opportunities, but also, by adding costs and weakening bargaining positions, prevent them from taking a greater share in the value-added chain. Women are particularly penalized by weaknesses in these areas in combination with gender bias. In general, these weaknesses also lead to producers being directly exposed to world market price volatility and create difficulties in access to finance. It is necessary to fill the institutional and capacity gaps that are now visible in many countries. In this light, donors should enhance their support to the strengthening of crucial trade-supporting institutions, in particular inspection and certification agencies, export promotion bodies, insurance firms, agricultural finance institutions and national and regional commodity exchanges.

10. **Preferential schemes and South-South trade**

21. In some cases preferential trade schemes can play a role in stabilizing and securing income of poor commodity producers, thus paving the way for subsequent development and diversification. Similarly, regional integration schemes as well as liberalization of trade among developing countries can have a role in expanding earnings from the commodity sector. The use and impact of such schemes could benefit from further research.

11. **Information and analysis**

22. We recognize that developing country Governments, firms and farmers suffer from a lack of access to timely, comprehensive, accurate and user-friendly information and analysis, as well as the capacity to utilize it in decision making at the government, firm and farm levels. Better strategic and organized information is needed at the international level for better decision-making (including in recognizing trends and real income losses resulting from terms of trade declines) and at the local level to give farmers the information they need, if possible on a real-time basis. In the first respect, we observe with serious concern the decline in resources devoted to the analysis of commodity issues in some of the international agencies. This is a significant bottleneck for identifying and exploiting markets and diversification opportunities. Better information flow to developing countries can help Governments to make better policy decisions and is also a necessary condition for avoiding wrong investment decisions that may lead not only to losses for new investors but also to situations of oversupply. We call for strengthening the capacity of UNCTAD and other competent international organizations to regularly disseminate specialized information and analysis covering a broad range of commodities and commodity issues and establish networks so as to contribute to market transparency, and to develop collaborative tools to facilitate the use of this information, particularly by producers.
12. Exchange of experiences on commodity policies

23. We note the interesting experiences of developing countries in devising innovative approaches to strengthen their commodity sector and cope with negative aspects (e.g. volatility). There is a need for more exchange of experience on commodity-related policy options and scope for greater South-South cooperation, and we urge UNCTAD to develop a proper forum for this.

13. Fiscal management and revenue utilization

24. In many countries, particularly those where revenues are obtained from fuels, minerals and exploitation of other natural resources, there is considerable room for improvement in fiscal management and revenue utilization which would lead to a greater contribution of the commodity sector to poverty alleviation. This should from now on become part of the policy debate between the Governments of such countries and international financial institutions/the donor community, with a focus on mobilizing substantial resources for institution building in fiscal management within a strong governance framework. Commodity-related fiscal risks (both quantity and price) and ways to manage such risks have to be part of the agenda of this policy debate forthwith. Competent organizations such as UNCTAD should do more to stimulate awareness of these issues and possibilities.

14. Risk management

25. Much of the burden of commodity price volatility is now borne directly by producers (with particularly severe effects on the poorest of them). Negative effects are also felt by processors, traders and consumers in developing countries. Producers in particular would benefit strongly from better price risk management – the increased likelihood of not receiving less than a certain price for their products. While not a panacea and requiring proper conditions for use, market-based tools for providing such security exist for a number of commodities.

26. The international community should play a more proactive role in this area. We feel that, with some urgency, efforts to create the capacity to manage commodity price instability should become a part of all rural development schemes, along with the various efforts to plan and prioritize development assistance (in particular, the Poverty Reduction Strategies as formulated under the aegis of UNDP and the World Bank, and the Integrated Framework for Trade-Related Technical Assistance for the Least Developed Countries set up in the context of WTO). Donor institutions should provide more support to implement programmes in this area.
C. Long-term recommendation

15. **International export diversification fund**

27. Ultimately, in order to drastically reduce poverty, countries need to fully utilize opportunities to diversify their productive capacity (within the commodity sector, including through value addition, and outside the sector). Having access to markets is a necessary condition, but not a sufficient one: they need to develop new supply capacity. The recommendations above should help in this respect. But the ability of countries to move away from excessive dependence on a few commodities would be much strengthened if, for their efforts, they had access to an “International Diversification Fund”. This could be linked to an existing institution, such as the Common Fund for Commodities.

28. This Fund would focus on developing private sector capacity. In addition to strengthening the institution-building and other relevant activities mentioned earlier, it would develop strong producer associations, with a proper role for the majority of producers (women); develop key infrastructure; and stimulate investments (e.g. by providing risk capital, or temporary compensation for certain infrastructural weaknesses).

29. We urge the international community to have a new look at such a Fund, and in particular, consider a new mode of financing it. This would be justified given the long-term decline in the terms of trade for commodity exports from developing countries, which implies a real resource transfer to consuming countries.

D. Concluding requests

30. While we feel that it is important that national Governments and the international community attach priority to commodity issues, along the lines of the recommendations above, we feel that there are certain areas where the United Nations, and in particular UNCTAD, can itself make significant steps. It this respect, we would like to transmit the following requests:

- That the Secretary-General of the United Nations distribute our findings to the relevant UN organizations, in particular UNDP, the international financial institutions and bilateral donors, suggesting that, in the light of the Millennium Development Goals and the importance of commodities for most of the world’s poor, they should upgrade the priority that they accord to commodity issues, and informing them that he will contact them again in one year’s time with a view to reporting to the General Assembly on how they have adapted their policies and programmes to the needs of the commodities sector.

- That UNCTAD explore the possibilities for a new partnership between Governments, private business, producers' and traders' associations, civil society and international organizations in the commodity area, and announce the shape and modalities of such a partnership, as well as concrete steps to implement it, at the forthcoming UNCTAD XI in June 2004.
• That the Secretary-General of UNCTAD contact the heads of the European Commission and the IMF in order to convey to them the importance of a properly functioning system of compensatory finance and to invite them to work with UNCTAD with a view to designing a system that meets the criteria we set out above.

• That the General Assembly assign to a competent organization the responsibility to lead open and transparent discussions with all relevant stakeholders on the creation of a new International Export Diversification Fund, along the lines discussed above.
II. SUMMARY OF DISCUSSIONS

Background

31. The eminent persons agreed that the seriousness of the problems associated with the volatility of commodity prices and the declining terms of trade could not be overstated. The impact on development efforts of commodity-dependent developing countries is felt at both the macro and the micro levels, increasing the vulnerability of these countries and undermining their efforts to fight poverty.

32. The eminent persons observed that, when principal petroleum and manufactured goods exporters are excluded, the terms of trade of developing countries have declined by more than 20 per cent since 1980. For African countries, which comprise the most commodity-dependent group, the decline is more than 25 per cent. Instability is the other important characteristic of commodity prices. The average monthly deviation from trend has been more than 10 per cent for many commodities of export interest to developing countries. Macroeconomic variables, such as savings and capital accumulation, balance of payments and exchange rates, public finances and, naturally, employment and growth rates are greatly affected by commodity prices and their reflection in export earnings in commodity-dependent countries. These negative impacts leave a long-lasting mark on development prospects, perpetuating the poverty trap generated by dependence on low-value commodity exports. The impact in the other direction is also very important. Large foreign debt burdens and currency devaluations create inducements to increase exports. In most developing countries the commodity sector is the sector most responsive to stimuli of this sort. An inescapable result is increased supplies on world markets, leading to downward pressure on prices.

33. The eminent persons emphasized that dealing with the problems of the commodity sector is a crucial element in reaching the Millennium Development Goals related to poverty reduction, and that this initiative of the General Assembly could provide new impetus to the search for solutions to the commodity problems of developing countries. Commodities had been taken off the predominant place in the international development agenda that they occupied for many years. Now, commodity issues are once again attracting the attention of the international community. However, international initiatives such as the PRSPs still do not take into account sufficiently the issues associated with the commodity sector.

34. It is important not to lose sight of the consequences in human terms of low commodity prices, particularly for the poorer and less powerful segments of the population, particularly the rural poor and women. In this context, food and income security for the poor should be an important objective. An ethical starting point for the discussion should be agreement to increase the possibility of attaining commodity prices that would be remunerative to producers and equitable to consumers. Exploitative practices caused by imbalances between the market power of small producers and large buyers should be prevented.
Price trends and volatility

35. It was agreed that it was difficult to generalize about the causes underlying declining commodity price trends and price volatility. Commodities and countries are different and different sets of factors influence price developments. Variations in exchange rates also introduce problems when assessing the development of commodity prices over the medium and long term. With respect to commodity price volatility it was considered important to include in any analysis such factors as the effect of subsidies and the role of terminal market operations.

36. For several commodities there is a global situation of excess supply, as output has increased at a faster rate than demand and this has contributed to the decline in their prices. In the case of some commodities, a significant factor has been the high subsidization of production, mainly in industrialized countries. In other cases, global over-supply may be due to a number of factors such as several countries deciding to increase output at the same time; advice provided by international agencies and by financial assistance programmes; and over-optimistic projections of demand and prices.

37. Part of the decline in real commodity prices over the past decades could be attributed to productivity increases realized for some commodities in some countries. It could therefore be questioned whether the producers in question are worse off now than decades ago. On the other hand, for many producers who have not been able to increase their productivity and yields and have not been able to diversify, the situation presents itself as one of declining incomes caused by excess supplies. Moreover, a negative trend in terms of trade can be observed for developing countries exporting commodities, and it is clear that commodity producers have not succeeded in retaining the gains of productivity improvements. It is also important to recognize that productivity increases could vary considerably within the same sector, with large modern operations often improving productivity at a faster rate than small producers. Many producers, for instance those in small island countries, also face specific constraints on productivity growth and diversification owing to climatic, geographical and demographic reasons.

Subsidies and trade barriers

38. It was agreed that export subsidies and market-distorting forms of domestic support for agricultural production and exports in developed countries have contributed significantly to output increases and price declines for products subject to such support and affected negatively the shares of developing countries in the markets for these products. Phasing out such forms of support would eliminate major detrimental effects on developing countries’ income and growth prospects and considerably enhance export opportunities for developing countries. Developed country tariffs on agricultural products, particularly more processed ones, are high, and other trade measures constitute significant obstacles to market entry for developing country commodity exports. It was also observed that the removal of barriers to trade among developing countries would have significant beneficial effects, inter alia by stimulating the development of new markets and thereby improving market diversification.
International cooperation on commodities

39. It was generally recognized that international cooperation between producers and consumers on commodity issues can provide the best opportunity for dealing with commodity problems if political and technical circumstances are favourable. However, such preconditions, particularly for commodity price stabilization actions of the traditional type, are not always present. In the absence of producer-consumer cooperation, it was suggested that producers cooperate among themselves to align supply with demand. Opinions were divided on the prospects for success of actions to limit supplies taken on the basis of cooperation between producers alone, although it was noted that examples of successful cooperation exist, including the one concerning natural rubber involving Indonesia, Malaysia and Thailand. The meeting also discussed the option of national-level measures to limit supplies during a situation of excess supplies and heard some cases of such national-level measures with beneficial results. It was also noted that, in some cases, the best cure for oversupply and depressed prices could be the development of new end-uses rather than the limitation of production.

Commodity-based development and diversification

40. The place of primary producers in the value chain is an important issue to consider in the case of commodity-based development and diversification. Improved competitiveness and successful diversification are principal avenues for strengthening this place so that a greater part of the value added is retained in the country. It was generally agreed that horizontal, vertical and geographic diversification is an integral part of the development process in commodity-dependent developing countries and that only a very small number of countries have been successful in basing economic development on the commodity sector, particularly the export of raw commodities, alone. Improved stability of prices will contribute to facilitating the diversification process by reducing risks to producers and allowing them to invest in diversification. It was also emphasized that diversification ultimately has to be the result of decisions taken at the level of individual producers. Diversification policies should enable them to make informed choices. Support for diversification, whether by Governments or by international agencies, should take into account both current and prospective world market conditions and avoid the risk of fallacy of composition. Diversification recommendations should not be based on static comparative advantages, but on dynamic considerations. Diversification is not, however, an end in itself but an element of development strategies. Competitive commodity producers should not have to diversify out of commodity production just because of market distortions such as those introduced by subsidies.

41. The design and implementation of successful diversification policies and strategies can be facilitated by international financial and technical assistance. The important role of the Common Fund for Commodities in financing diversification projects through its second account was recognized and the need to strengthen its financing capacity was emphasized.
42. The eminent persons also recognized that access to reliable information on commodity markets is often a major problem for developing country producers and that the asymmetry in access to information is highly problematic.

43. In the context of commodity-based development and diversification, the importance of sound fiscal management was emphasized, and it was noted that volatility in export earnings and government income tends to have negative impacts on the quality of public expenditure management. Income from commodity exports needs to be invested in human capital to improve prospects for sustainable development. It was noted that the environmental costs and benefits of commodity production also need to be seen as important elements in designing policies. Moreover, it is important to promote the dissemination of examples of successful policies among developing countries.

Policies and measures for recommendation

44. The eminent persons discussed a wide variety of possible recommendations for dealing with the problems of the commodity sector. Their recommendations are presented in part II of this report.

45. As regards measures to deal with price declines, volatility, the need for diversification and strengthening the contribution of the commodity sector to development, the eminent persons agreed that it is useful to divide possible actions into three categories: to be taken immediately, in the medium term and the long term. It was recognized that, in many areas, actions in different time perspectives will be complementary. Some commodities – particularly coffee and cotton – pose problems that need immediate solutions. For others, including most mineral commodities, medium- to long-term solutions are more important. It was argued that actions should target commodities that are going through crises and where the effects are of major significance for countries and vulnerable populations. There are also differences between countries with respect to problems, often as a result of differences in size and institutional capacity. It was therefore noted that there are no solutions that would fit all cases.

46. The desirability of measures to compensate export earnings shortfalls was mentioned repeatedly. It was recognized that previous and existing schemes have suffered from excessive conditionalities. One argument advanced in this context was that schemes based on insurance against shortfalls would be a better approach than ex post compensatory schemes. Such schemes should be backed by market-based instruments such as options to limit cost. Capacity-building measures and crop management systems were also mentioned in this context.

47. The abolition of marketing boards and other support structures in many countries has led to the disappearance or deterioration of some crucial services such as the provision of information, credit and extension services. It also weakened the bargaining power of developing country producers. The resulting institutional vacuum needs to be filled. In this context, Governments, the private sector and intergovernmental organizations should play
separate but complementary and mutually supportive roles. Attracting investors and investing in research and development are important elements of commodity-based development and diversification strategies.

48. The concept of diversification funds attracted considerable interest. Possible ways of financing such funds were discussed. It was recognized that specific taxation for this purpose is not a realistic option. Concern was also expressed that existing ODA funds might be diverted from other purposes. The effort could be made to take the developed countries closer to their Monterrey targets. It was suggested that, as a basis for the allocation of the financing burden among donor countries, their share in developed country commodity imports from affected developing countries could be used. Several options for financing diversification that will be discussed in the International Coffee Organization, including the possibility of introducing a fee on coffee trade, were mentioned.

49. It was agreed that, ideally, measures to limit supply should be undertaken in cooperation between producers and consumers. If that were not possible, however, producers would have to agree on methods among themselves. This would be facilitated if consumers were prepared to abstain from actions to block any such plans. If coordinated action by producers is not possible, production and/or export cuts would have to be implemented on an individual country basis.

50. The relationship between indebtedness and commodity dependence was discussed and it was noted that export earnings shortfalls due to commodity price volatility should be included among the criteria for debt relief. Historical examples of debt being indexed to commodity prices through the issuance of bonds linked to commodity prices were mentioned in this context.
Annex

LIST OF PARTICIPANTS

Datuk Dr. ABDULLAH bin Mohd. Tahir
Secretary General, Ministry of Primary Industries
Kuala Lumpur

Mr. Tony ADDISON
Deputy Director, WIDER
Helsinki

Ms. Sylvia BORREN
Executive Director, NOVIB Oxfam
Amsterdam

Prof. Philippe CHALMIN
Université Paris Dauphine
Paris

Mr. Pierre DEFRAIGNE
Deputy Director-General, Trade, European Commission
Brussels

Mr. Getachew GEBRE–MEDHIN
Principal Project Manager, Common Fund for Commodities
Amsterdam

Mr. Roman GRYNBERG
Commonwealth Secretariat
London

Dr. Irfan ul HAQUE
Commodities consultant, G-24

Mr. Martin KHOR
Third World Network
Kuala Lumpur

Mr. Jean-Pierre LANDAU
Minister plenipotentiary, French Embassy
London
Mr. Peter Brabeck-Letmathe  
Vice-chairman and CEO  
Nestlé SA  
Vevey

Mr. Francisco OURIQUE  
Adviser to the Coffee Committee, Brazilian Congress

H.E. Mr. Mandé SIDIBÉ  
Former Prime Minister of Mali

Prof. Clive THOMAS
