### Notes:

- The measure of price instability is  $\frac{1}{n} \sum_{t=1}^n [ ( | Y(t) - y(t) | ) / y(t) ] * 100$ , where Y(t) is the observed magnitude of the variable, y(t) is the magnitude estimated by fitting an exponential trend to the observed value and n is the number of observations. The vertical bar indicates the absolute value (i.e. disregarding signs). Accordingly, instability is measured as the percentage deviation of the variables concerned from their exponential trend levels for a given period.
- The growth rate of each period has been calculated using the formula  $\log(p) = a + b(t)$ , where p is the price index and t is time.
- Constant 1985 dollars (current dollars divided by the United Nations unit value index of manufactured goods exported by developed economies).
