SCIENCE, TECHNOLOGY AND INNOVATION FOR URBAN SUSTAINABILITY ENHANCEMENT: LEARNING FROM THE PRACTICE

Dr Luca Mora

Professor of Urban Innovation, Edinburgh Napier University & Tallinn University of Technology

STI for urban sustainability enhancement: **learning from the practice**

STI solutions to urban sustainability challenges

Main urban sustainability challenges

- Inefficient and polluting urban energy systems
- Unsustainable urban production and consumption patterns
- Urban water scarcity
- Urban traffic congestion and vehicle emissions
- Limited access to decent urban employment opportunities and growing inequalities
- Unaffordable and poor-quality housing
- Uneven access to quality education
- Gender-based inequalities and violence against women and girls
- Defective urban planning practices
- Vulnerable healthcare systems
- Urban violence and insecurity
- Vulnerability to natural disasters

STI solutions can help boost all dimensions of sustainable urban development

One size does not fit all: Framing smart city policy narratives within regional socio-economic contexts in Brussels and Wallonia

ARTICLE INFO

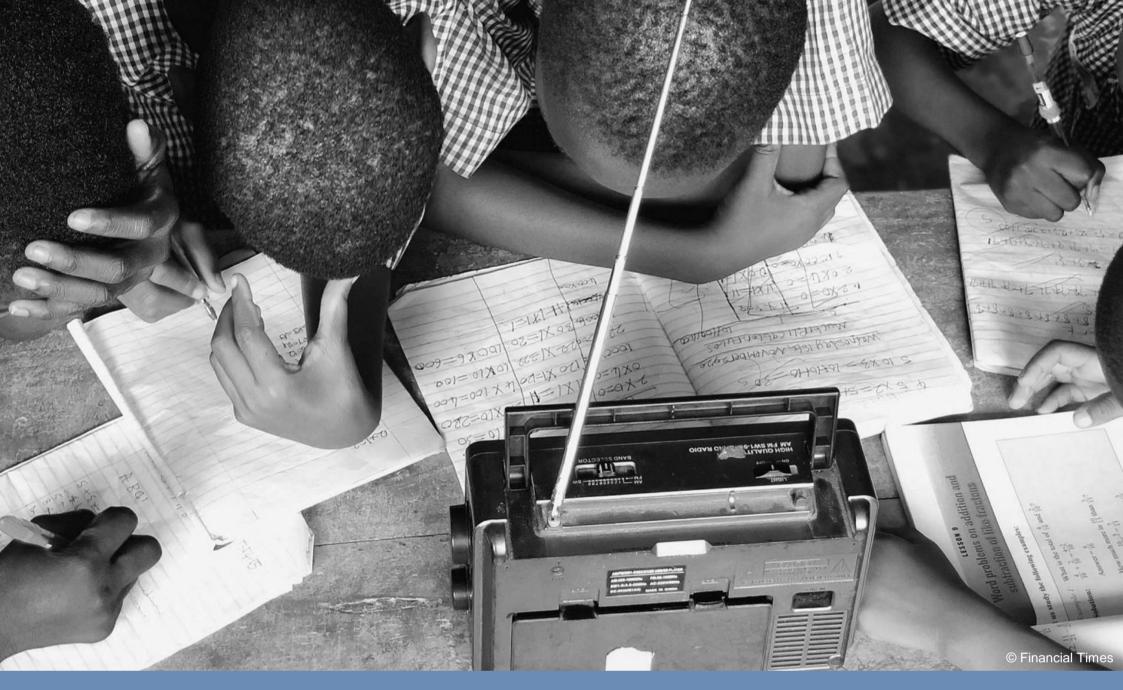

Keywords: Smart city policies Regional governments Narrative policy framework Socio-economic context

ABSTRACT

Smart city initiatives are increasingly dominating urban policy scripts worldwide, and their diffusion is centered upon different regional strategies. Adopting the Narrative Policy Framework as methodological basis, this article examines the smart city strategies developed by the Wallonia and Brussels-capital regions during the 2014–2019 period. Moving away from corporate-led deterministic models of smart city development, it shows that there is no one-size-fit-all approach to smart urbanism. Regional governments attribute different meanings to urban innovation and formulate place-based strategies of smart city development in relation to their socio-economic contexts, seeking to advance technological solutions to what they perceive as the most pressing problems of their territories and populaces.

1. Introduction

Smart city initiatives are complex transformational processes consisting of profound modifications of 'soft' and 'hard' components of existing urban regimes (Angelidou, 2014; Wahlström et al., 2020). These initiatives can be understood as urban strategies to advance technotechnological deployment (Mora, Deakin, Reid, 2019a). Nevertheless, despite its ambiguity, the smart city concept is increasingly dominating urban policy scripts through narratives that shape the strategic development of urban technologies (Lorquet & Pauwels, 2020; Söderström et al., 2014; Visser, 2019). Within this context, this article explores how narratives, while reducing the ambiguity of the smart city concept.

Changing lives by pumping water uphill

DESCRIPTION SDGS & TARGETS DELIVERABLES & TIMELINE RESOURCES MOBILIZED FEEDBACK

Intro

This practice is about pumping water uphill to waterless villages and farms with the AIDFI ram pump, a device which pumps water from lower to higher elevation without the use of fuel or electricity 24/7 and without emission of GHG's. The water volume delivered by the AIDFI ram pump increases changes the lives of the villagers, especially the women who need water for most of their activities. Upland farms which were in the past rainfed, can survive their first crop, add a second crop or diversify their farm. The upland beneficiaries we reach with the AIDFI ram pump can be considered poorest of the poor and mostly engaged in agriculture. The ram technology covers most of the SDG's.

Description

For drinking and household to: - Save time and money from manually fetching and spent it on other productive activities - Improve health, nutrition and sanitation by growing of vegetables, eradication of waterborne diseases through water filters, raising of animals and construction of toilets - Have kids follow uninterrupted education by no longer having to skip classes for water fetching - Diminish skin diseases by regular bathing - Unburden the women by providing possibility to do laundry near the house For irrigation to: - Survive dry periods during first crop - Add a second crop - Diversify the farm - Provide option for kids to become farmer For environment to: - Provide Green Jobs through manufacturing and installation of ram pumps - Avoid destruction of environment like charcoal making etc. by providing economic alternatives.

Contribution to SDG Implementation

AIDFI is a Social Enterprise which is tackling social problems with focus on lack of easy access to water. Nearly all SDG's are related or dependent on water. The work of AIDFI with the water powered non-polluting ram pump with its huge impact on the lives of upland villagers and farmers started
