### Other notes

Calculation of annual average growth rates. In general, they are defined as the coefficient  $b$  in the exponential trend function  $y^t = ae^{bt}$  where  $t$  stands for time. This method takes all observations in a period into account. Therefore, the resulting growth rates reflect trends that are not unduly influenced by exceptional values.

Population growth rates are calculated as exponential growth rates.

The term "dollars" (\$) refers to United States dollars, unless otherwise stated.

Details and percentages in tables do not necessarily add to totals because of rounding.

The following symbols have been used:

A hyphen (-) indicates that the item is not applicable.

Two dots (..) indicate that the data are not available or are not separately reported.

A zero (0) means that the amount is nil or negligible.

Use of a dash (–) between dates representing years, e.g. 1980–1990, signifies the full period involved, including the initial and final years.
