## ACKNOWLEDGEMENTS

This study was prepared by Clovis Freire, Chief, Technology and Innovation Policy Research Section of UNCTAD, under the guidance of Angel Gonzalez Sanz, Head of the Technology, Innovation and Knowledge Development Branch, and with the overall direction of Shamika N. Sirimanne, Director of the Division on Technology and Logistics.

Haomin Zhang designed the cover and the layout. Xiahui Xin and Malou Pasinos provided administrative support.

## NOTE

The United Nations Conference on Trade and Development (UNCTAD) serves as the lead entity within the United Nations Secretariat for matters related to science and technology as part of its work on the integrated treatment of trade and development, investment and finance. The current UNCTAD work programme is based on the mandates set at quadrennial conferences, as well as on the decisions of the General Assembly of the United Nations and the United Nations Economic and Social Council that draw upon the recommendations of the United Nations Commission on Science and Technology for Development, which is served by the UNCTAD secretariat. The UNCTAD work programme is built on its three pillars of research analysis, consensus-building and technical cooperation, and is carried out through intergovernmental deliberations, research and analysis, technical assistance activities, seminars, workshops, and conferences.

The term "country" as used in this study also refers, as appropriate, to territories or areas. In addition, the designations of country groups are intended solely for statistical or analytical convenience and do not necessarily express a judgment about the stage of development reached by a particular country or area.

## Introduction

This catalogue presents potential new products for diversification for 233 economies based on the analysis of their economic complexity and position in the product space. Its objective is to inform governments, private sector and other stakeholders of the national innovation systems on possible directions for technological transformation of these economies.

Technological transformation happens through the establishment of a production that is new to the country (product innovation resulting in economic diversification) or the modification in the way that a product is produced (process innovation) to increase productivity and reduce costs. Both forms of innovation also trigger changes in income, consumption, employment and output, which result in structural economic change.

Technological transformation drives structural transformation when process and product innovation results in a change in the structure of the economy in which employment and output move from low productivity sectors to existing or new sectors that are more productive (associated with higher levels of technology). Innovation is the combination of existing technologies in new configurations or economic activities. This combination usually requires the exchange of knowledge among firms, research centres, universities, governments, consumers, which are the main actors of the national innovation systems. Firms (and their entrepreneurs) have the key role of taking the risk to innovate (bringing a new good or service to the market). The decision to innovate depends on many factors, not only the availability and access to technology. Path dependency is a characteristic of innovation, given that it requires a combination of existing technologies. Larger "jumps" in innovation, in which some of the technologies combined are not available in the economy and have to be learned or transferred from abroad, require more support from Governments to facilitate innovation. Incentives for innovation are affected by the global demand for new or improved products.

Product innovation (or imitation) is critical for structural transformation, by diversifying the economy adding more productive sectors. Considering that each product requires specific capital- and labour-embodied technologies to be produced, the more diversified an economy, the higher its technological level. The information about the level of diversification and how common is the exports of the country can be used to compute indices that serve as a proxy of the level of technologies in the economy (or productive capacities) or the so-called economic complexity (Hidalgo and Hausmann, 2009; Tacchella et al., 2012). Indices are also used to estimate the level of technology that goes into the production of each product. More complex products are considered to require higher levels of technology. Development is associated with diversification towards products that have above average complexity in the country (Freire, 2017).

Development policies should be designed to facilitate that process. Their implementation involves the selective promotion of new economic activities through targeted industrial policies. That requires the identification of the appropriate sectors and products to target based on the productive structure of the country and changes in global demand.

## How to use this catalogue?

The catalogue presents information on four main areas:

- Basic statistics regarding diversification
- Potential new sectors for diversification considering all products, and the markets that offer growing export opportunities
- Potential new sectors for diversification considering only agri-business products, and the markets that offer growing export opportunities
- Examples of potential new products with higher export opportunities

## Basic statistics

A brief explanation of the information presented in the table follows below:

## Country A

| Current diversification (number of products) |  | Potential new products more complex (percentage)(100*b/a) |  |
| :---: | :---: | :---: | :---: |
| Shows the number of products exported by the country A. This is based on trade classification HS 6-digit and further disaggregated by unity price range. In this case, country A exported 2,237 products (categories) in 2019. <br> See Annex for technical details. | 2,237 | Shows the percentage of potential new products that are also more complex than the average product exported by country $A$. <br> If this percentage is higher than $50 \%$, this suggests that when considering existing productive capacities of the country, entrepreneurs would more likely innovate towards products that are more complex than the average product complexity of the country. This is an encouraging result because countries develop by diversifying towards more complex products. <br> This measure considers only the supply (technological) capacity of the economy. The measure below considers the demand in global markets. | 74 |
| Potential new products (a) |  | Export opportunity in more complex (percentage) | ducts |
| Shows the number of potential new products that country A could export with high probability - i.e. eight in every ten countries that export the products exported by $A$ also export these potential new products not yet exported by country $A$. There are 3,848 such potential new products in the case of country $A$. | 3,848 | Shows the percentage of potential export opportunities, in terms growing markets, of new products that are more complex, in total export opportunities. <br> If this percentage is higher than $50 \%$, this suggests that when considering both existing productive capacities of the country and global demand for products, entrepreneurs would more likely innovate towards products that are more complex than the average product complexity of the country. | 49 |

|  |  | In this case shown here, the value is $49 \%$, thus it is more likely that entrepreneurs would diversify towards products with lower complexity than the country's average, which is problematic because it does not promote the increase of technological capacity of the country. |  |
| :---: | :---: | :---: | :---: |
| Potential new products more complex t country's average (b) | an the | Import replacement opportunity in more co products (percentage) | plex |
| Shows the number of potential new products that country A could export with high probability and that are more complex than the average product exported by country $A$. | 2,833 | Shows the percentage of potential import replacement opportunities of new products that are more complex, in total import replacement opportunities. <br> When this percentage is lower than $50 \%$, and in the case of this example (28\%), this suggests that it is less likely that entrepreneurs would innovate towards more complex products when innovating by producing a new product aiming at import substitution. | 28 |

## Percent

This field shows the percentage of export opportunity.
The higher this number, the more the opportunities for export of potential new products for diversification under this sector.

## Top markets for potential new products (percentage of export opportunities)

This section shows the top markets of the potential new products for diversification that have complexity above the country's average. These are the markets in which the demand for the potential new products is increasing the most.

## Potential new sectors for diversification (Agri-business products)

Sectors with higher export opportunities (percentage of export opportunities in agri-business)
